# pandoc-source-exec examples

#### Sebastian Höffner

### March 2017

## Preamble

Compile this document as follows:

```
pandoc --filter pandoc-source-exec \
    --highlight-style tango \
    -o example.pdf example.md
```

# Usage

To execute code, add the class exec to your code:

```
'``{ .python .exec }
print('Hello World')
'``
```

This results in:

```
print('Hello World')
```

Output:

```
Hello World
```

You can also supply the interpreter keys in the runas argument:

```
```{ .python .exec runas=python2 }
print 'Hello World'
```

Or you can simply make up your own command:

```
...{ .exec cmd='/usr/bin/env python2 -c' }
print 'Hello World'
```

# Examples

#### No execution

```
a = 3 + 5
print(a)
```

## Simple execution

```
Using: { .python .exec }
print('Hello World')
Output:
Hello World
```

#### Advanced execution

```
Known interpreter { .python .exec runas=python2 }:

print 'Hello World'

Output:

Hello World

Custom interpreter { .exec cmd='/usr/bin/env python2 -c' }:

print 'Hello World'

Output:

Hello World

Or ruby { .exec cmd='/usr/bin/env ruby -e' }:

puts 'Hello World!'

Output:

Hello World!'
```

#### Errors

```
\label{eq:stderr} \mbox{stderr} \mbox{ is piped to stdout, so that errors can also be shown.} \\ \mbox{Using: { .python .exec }} \mbox{}
```

### File execution

```
Using: { .python .exec file='example.py' }
File: example.py
import math

a = 3
b = 4
c = math.sqrt(a ** 2 + b ** 2)
print(c)
Output:
5.0
```

### File without execution

```
Using: { .python file='example.py' }
File: example.py
import math

a = 3
b = 4
c = math.sqrt(a ** 2 + b ** 2)
print(c)
```

#### Interactive execution

```
Using: { .python .exec .interactive }
Interactive code will also be detected if the code block starts with >>>.
```

Note: This only works with python code so far, a custom command is not possible.

Note: The REPLWrapper changed, so this does only provide very limited support. In particular, only single-line-statements can be executed.

```
>>> a = 5 + 4
>>> 9 == a
True
>>> print(a)
9
```

### API

The following keywords (classes denoted by a prefixed ., attributes with a following =) exist:

- .caption and caption= Mutually exclusive. If .caption is used, instead of printing File: ... above the code, a caption is created below (using the LaTeX package caption) the listing and in the compiled LaTeX document the \listofcodelistings macro becomes available. To specify a custom caption, use caption="My caption". If a filename was specified, this would render to "My caption (path/to/file.py)".
- cmd= Allows to specify a custom interpreter command to execute the code.
  For example, to run ruby code one could use cmd='ruby -e'.
- **.exec** Executes the following code cell according to the specified language. By default, it is only **echo**ed.
- file= Replaces the code cell with content from the specified file. This searches recursively for files matching the pattern, so if you use file=code.py but your code is in fact in src/code.py it will still be found. Specify the full path to avoid ambiguities.
- .interactive Executes the code as if it was inserted into an interactive session, returns results inline into the original code block. Only works for python code so far.
- runas= Executes code with the specified executor, e.g. python2 to distinguish it
  from python which defaults to python3. Can be overwritten by specifying
  cmd=.
- .hideimports Hides import statements in output. Currently only supported for Python.
- pathlength= Limits the number of path elements for a filename. If a path is
   e.g. a/b/c/code.py and pathlength=2, only c/code.py is shown. This
   is only useful using file=.

#### Supported languages

To be used with runas=, if it does not already match the language identifier:

- $\bullet$  default
- perl
- php
- pythonpython2
- python3
- ruby

#### default

default

Output:

default

#### perl

```
print 'perl';
```

Output:

perl

## $\mathbf{php}$

```
echo 'php';
```

Output:

php

### python

```
print('python')
```

Output:

python

## python2

```
print 'runas=python2'
```

```
Output:
runas=python2

python3
print('runas=python3')

Output:
runas=python3

ruby

puts 'ruby'

Output:
ruby'
```

## Removing imports

```
Removing imports affects only the final code rendering, not the execution.
```

```
import statistics

print(statistics.mean([1, 2, 3])
```

Results in

```
print(statistics.mean([1, 2, 3]))
```

Output:

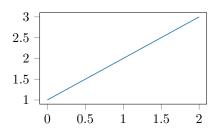

2

# Plotting matplotlib

```
import matplotlib.pyplot as plt
plt.plot([1, 2, 3])
```

```
import matplotlib.pyplot as plt
plt.plot([1, 2, 3])
```

Output:

Additionally width=6cm and height=5cm can be used. As a shortcut, one can instead use plt=6cm,5cm.

```
import matplotlib.pyplot as plt

plt.plot([1, 2, 3])

import matplotlib.pyplot as plt

plt.plot([1, 2, 3])
```

Output:

### Captions

Captions make proper "listing" environments, which are floating. They are set to [htbp].

#### A normal "captionized" file

This is Code Listing 1.

```
```{ .python .caption file='example.py' }
...
```

```
import math
a = 3
b = 4
c = math.sqrt(a ** 2 + b ** 2)
print(c)
```

Code Listing 1: example.py

#### A custom caption

This is Code Listing 2.

```
```{ .python caption="Custom caption" file='example.py' }
...
```

```
import math
a = 3
b = 4
c = math.sqrt(a ** 2 + b ** 2)
print(c)
```

Code Listing 2: Custom caption (example.py)

#### Caption for a normal code block

This is Code Listing 3.

```
```{ .python caption="Caption for a normal code block" }
print('Hello World!')
```

```
print('Hello World!')
```

Code Listing 3: Caption for a normal code block

#### **Empty caption**

This is Code Listing 4. Note that empty captions are not included in the list of code listings (see below).

```
print('Hello World!')
print('Hello World!')
```

 ${\rm Code\ Listing\ 4}$ 

#### Caption with execution does not work well

```
This is Code Listing 5.

'``{ .python .exec caption="Simple 'Hello World'" }

print('Hello World!')

Output:

Hello World!
```

Code Listing 5: Simple 'Hello World'

#### List of Code Listings

\listofcodelistings

# List of Code Listings

1	example.py	8
2	Custom caption (example.py)	8
3	Caption for a normal code block	8
5	Simple 'Hello World'	ç
